

Multinomial Distribution

[< Previous](#)[Next >](#)

Multinomial Distribution

Multinomial distribution is a generalization of binomial distribution.

It describes outcomes of multi-nomial scenarios unlike binomial where scenarios must be only one of two. e.g. Blood type of a population, dice roll outcome.

It has three parameters:

n - number of times to run the experiment.

pvals - list of probabilities of outcomes (e.g. [1/6, 1/6, 1/6, 1/6, 1/6, 1/6] for dice roll).

size - The shape of the returned array.

Example

[Get your own Python Server](#)

Draw out a sample for dice roll:

```
from numpy import random

x = random.multinomial(n=6, pvals=[1/6, 1/6, 1/6, 1/6, 1/6, 1/6])

print(x)
```

Note: Multinomial samples will NOT produce a single value! They will produce one value for each `pval`.

Note: As they are generalization of binomial distribution their visual representation and similarity of normal distribution is same as that of multiple binomial distributions.

Exercise ?

The `random.multinomial()` method has three parameters, which ones?

- ☐ `loc` `scale` `size`
- ☐ `n` `pvals` `size`
- ☐ `loc` `dev` `size`
